Speciality Lubricants
Maintenance Products

35 YEARS OF TRIBOLOGICAL EXPERTISE – MADE IN GERMANY

OKS – your professional partner for chemotechnical special products

The OKS brand stands for high-performance products for reducing friction, wear and corrosion. Our products are used in all the areas of production and maintenance technology in which the performance limits of classic lubricants are exceeded.

Quality – Made in Germany

The continued success of OKS for more than 35 years is decisively characterised by the high quality and reliability of our products, as well as the fast implementation of customer requirements through innovative solutions.

The products developed by OKS engineers and chemists are produced under strict quality requirements in Maisach near Munich, Germany, our company's headquarters. Worldwide distribution is carried out just-in-time from Maisach, supported by a modern logistics centre.

The long-standing certifications by the TÜV SÜD Management Service GmbH in the fields of quality (ISO 9001: 2008), environment (ISO 14001: 2004) and work protection (OHSAS 18001: 2007) are proof of the high OKS quality standard.

A company of the Freudenberg Group

Since 2003 OKS Spezialschmierstoffe GmbH has been part of the international Freudenberg Group, with headquarters in Weinheim, Germany. We utilize the comprehensive know-how and the innovative power of the Freudenberg Chemical Specialities (FCS) division for the further development of new products and markets to ensure the continued dynamic growth of our company in the future.

OKS – Partner to Trade

Our speciality lubricants and chemotechnical maintenance products are sold exclusively via the technical and mineral oil trades. The consistent strategy of "sales only via trade", the smooth processing of orders and our comprehensive technical service make us one of the preferred partners for demanding customers worldwide. Use our specialist's know-how. Put us to the test.

Experts from a wide range of different disciplines work in our laboratories with state-of-the-art systems and test equipment to modify existing or develop new products for special application cases.

Reduction of friction and wear through optimal lubrication

Several billion Euros of economic losses are caused every year through friction and wear. In order to reduce these cost extensive tribological basic research is carried out. On this basis, companies then occupy themselves with specific knowledge, such as OKS Spezialschmierstoffe GmbH with the development of high-performance lubricants.

Friction

What is friction?

Friction is the mechanical resistance to the relative movement of two surfaces. Friction is usually undesirable in technical systems, because it is associated with energy loss, friction heat and wear.

Coefficient of friction

Determining the coefficient of friction

The following equation is used to determine the friction (to Coulomb).

$$\frac{F_R \text{ (frictional force)}}{F_N \text{ (normal force)}} = \mu \text{ (coefficient of friction)}$$

Friction can be divided into sliding friction, pivoting friction, rolling friction and rolling resistance friction.

Tribological system

The tribological system

For an optimal problem solution all the influencing variables in a tribological system have to be known. Allowances have to be made for the complex interactions of these factors. Ambient influences (dust, temperature or moisture) and structural factors (material, surface or geometry of the friction bodies) play just as great a role as stress factors (speed, pressure stress or vibrations) as far as selecting the correct intermediate material (= lubricant) is concerned.

Stribeck curve

Stribeck curve

The course of the coefficient of friction of a friction bearing with oil or grease lubrication in the various friction and lubrication states can be described using the Stribeck curve as an example.

During the start-up phase the static friction is followed by the solid state friction (high coefficient of friction/high wear). As speed increases a partial separation of the sliding surfaces takes place in the mixed friction phase by the lubricating film (medium coefficient of friction/medium wear). The emergency running film that is formed by solid lubricants protects at exactly this point (see red curve). At high speeds a hydrodynamic liquid film separates the sliding surfaces completely from each other (as at aqua-planing). In this phase of liquid friction the lowest wear and the lowest friction is achieved.

Spectrum of tasks of a lubricant

Multiple function of the lubricants

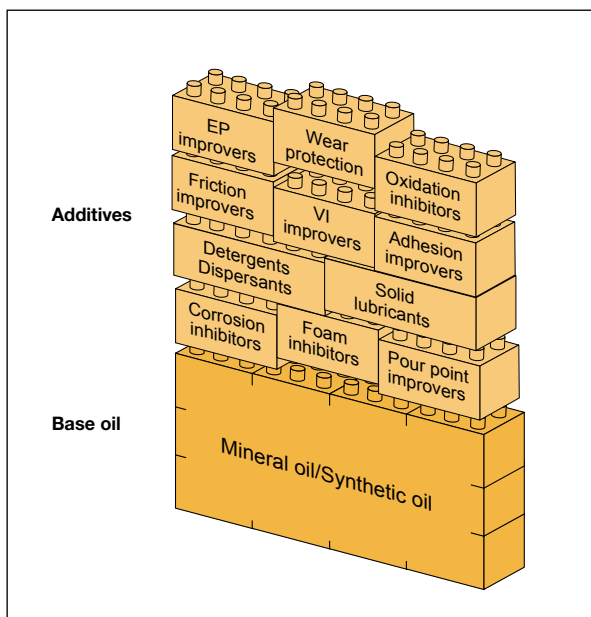

The functions of a lubricant can be varied and, depending on the particular application, can be necessary alone or in combination. Besides the primary demand placed on the lubricant – maximum power transfer combined with a minimum of friction and minimum wear – it is often necessary to fulfil various secondary properties such as water resistance, chemical resistance, compatibility with plastics or corrosion protection.

Oils with high-performance additives for reliable lubrication

Oils dissipate heat well from the lubricating point. In addition, they have a notably good creep and wetting behaviour. Therefore oil lubrication is often used at high temperatures or high speeds of rotation. Typical fields of application are gears, chains, friction bearings, hydraulics and compressors.

Characteristics of oils

Characteristic	Standard	Description
Viscosity	DIN 51 562-1	Dimension for the inner friction of liquids
ISO VG	DIN 51 519	Classification of oils into viscosity classes based on DIN 51 561
Operating temperature		Temperature range of the optimal performance
Flashing point	DIN ISO 2592	Lowest temperature at which the vapour-air mixture catches fire through extraneous ignition
Setting point	DIN ISO 3016	The lowest temperature at which the oil is still just capable of flowing

Structure of high-performance oils

Structure of high-performance oils

The additives play an important role in the formulation of a high-performance oil in addition to the careful selection of the base oil (type, viscosity) and has considerable influence on the price-performance ratio. Modern lubricating oils are conceived so that when the oil film is breached, the active ingredients form a protective film, so that the surfaces are protected against wear.

TYPES OF LUBRICANTS

Properties of base oils

The base oil plays a decisive role in the selection of a lubricating oil. Mineral oils, synthetic hydrocarbons (polyalphaolefines = PAO), ester, polyglycols and silicone oils differ notably in their physical properties and chemical behaviour.

Properties	Mineral oils	Synthetic hydrocarbons (PAO)	ester oils	Polyglycol oils	Silicone oils
Density 20°C [g/ml] approx.:	0.9	0.85	0.9	0.9 – 1.1	0.9 – 1.05
Setting point [°C] approx.:	-40 → -10	-50 → -30	-70 → -35	-55 → -20	-80 → -30
Flashing point [°C] approx.:	< 250	< 200	200 → 270	150 → 300	150 → 350
Resistance to oxidation	-	+	+	+	++
Thermal stability	-	+	+	+	++
Compatible with plastics	+	+	-	type-dependent	+

Compatibility of oils

The miscibility of different lubricating oils is influenced considerably by the base oils and has to be observed correspondingly when changing the lubricating oil, under consideration of the viscosity.

	Mineral oil	Polyalphaolefines	ester oils	Polyglycol oil	Silicone oil (methyl)	Silicone oil (phenyl)	Polyphenylether oil	Perfluoropolyether oil
Mineral oil	■	■	■			□		
polyalphaolefines	■	■	■

perfluoropolyether oil								■

■ miscible □ partially miscible

Oils with high-performance additives for reliable lubrication

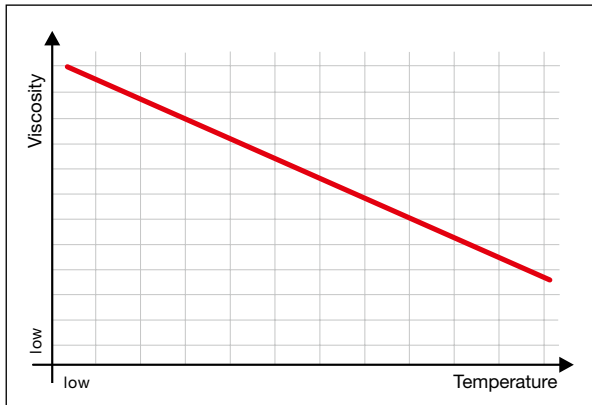

Viscosity

Viscosity – the dimension for the inner friction of liquids

The choice of the viscosity of an oil depends on the area in which the lubricant is used. The following basically applies: Low viscosity for low pressure stress and high sliding speeds, high viscosity for high pressure stress, low sliding speeds and high temperatures. The viscosity can be determined with different measuring processes (see Test and measuring processes).

The kinematic viscosity is specified in mm^2/s and is used for classification. The dynamic viscosity is specified in mPa s . The two viscosities can be converted into each other under consideration of the density with the equation: $\text{Dynamic viscosity} = \text{Density} \times \text{kinematic viscosity}$.

Temperature dependence of the viscosity

Dependency of the viscosity from the temperature

The viscosity of an oil depends on the temperature, the pressure and shear stress as well as the time in which it happens. The most important influencing factor is the temperature. As the temperature increases, the viscosity decreases and vice versa, depending on the type of oil.

TYPES OF LUBRICANTS

The classification of lubricating oils into viscosity classes is effected to ISO (DIN 51519) or SAE (Society of Automotive Engineers).

Kinematic ISO-VG	Viscosity (40 °C) [mm ² /s]
15	13.5 – 16.5
22	19.8 – 24.2
32	28.8 – 35.2
46	41.4 – 50.6
68	61.2 – 74.8
100	90 – 110
150	135 – 165
220	198 – 242
320	288 – 352
460	414 – 506
680	612 – 748
1,000	900 – 1,000
1,500	1,350 – 1,650

Viscosity classes to DIN 51519

ISO viscosity classes to DIN 51519

ISO-VG (Viscosity Grade) classes apply only for industrial lubricating oils. There are 18 kinematic VG classes from 2 mm²/s to 1,500 mm²/s. Determining of the viscosity is carried out at 40 °C.

Comparison of the viscosity classes to ISO-VG and SAE

Viscosity classes to SAE

Lubricating oils for vehicle gears and motors are classified into SAE viscosity classes. These range from 0 – 60 at motor oils and from 70 – 250 at gear oils. The viscosity values are measured at 100 °C.

Greases for long-term lubrication under critical operation conditions

If, for structural reasons, no oil lubrication is possible or if a cooling function is not required, a lubricating grease is used in most cases. Greases consist of a base oil that is bound by a thickener (soap). This ensures that the lubricant remains at the lubricating point. There it ensures permanently effective protection against friction and wear and seals the lubricating point against external influences such as moisture and foreign matter. Greases are often used at rolling and friction bearings, spindles, fittings, seals, guides, but also at chains and gears.

Characteristics of greases

Characteristic	Standard	Description
Base oil viscosity	DIN 51 562-1	Influences the speed range and load capacity of a grease
Drop point	DIN ISO 2176	Exceeding of this temperature results in destruction of the grease structure
Operating temperature	DIN 51 805 – Min DIN 51 821/2 – Max	Temperature range of the optimal performance at roller bearing greases
Speed parameter (DN value)		Maximum rotating speed up to which a grease can be used in a roller bearing
Consistency	DIN ISO 2137	Dimension for the stability of a grease (worked/unworked penetration)
NLGI grade	DIN 51 818	Classification to the consistency classes to DIN ISO 2137
Four-ball test	DIN 51 350	Determining of the wear protection and of the maximum load capacity of a roller bearing grease

Structure of greases

Structure of greases

The main difference in the structure of greases compared to oil is the thickener which determines the typical performance features of a grease.

Modern lubricating greases are formulated so that their active ingredients form an emergency running lubricating film in case of critical stresses and ensure operational reliability.

TYPES OF LUBRICANTS

Influence of the thickener on the performance features of a grease

Thickener (soap)	Operating temperature [°C]		Drop point [°C]	Water resistance	Load capacity
	Mineral oil	Synthetic oil			
Calcium	-30 → 50	n.a.	< 100	++	+
Lithium	-35 → 120	-60 → 160	170 / 200	+	-
Al-complex	-30 → 140	-60 → 160	> 230	+	-
Ba-complex	-25 → 140	-60 → 160	> 220	++	++
Ca-complex	-30 → 140	-60 → 160	> 190	++	++
Li-complex	-40 → 140	-60 → 160	> 220	+	-
bentonitee	-40 → 140	-60 → 180	without	+	-
Polycarbamide	-30 → 160	-40 → 160	250	+	-

Compatibility of greases

In addition to the compatibility of the base oils, the miscibility of the thickeners has to be taken into account when changing greases. An incompatibility has a negative influence on the performance of the lubricating grease.

	Ca-soap	Ca _x -soap	Li-soap	Li _x -soap	Li/Ca-soap	Na-soap	bentonitee	Ba _x -soap	Al _x -soap	Poly-carbamide

TYPES OF LUBRICANTS

Greases for long-term lubrication under critical operation conditions

Consistency of a lubricating grease

Consistency of a lubricating grease

At lubricating greases the consistency is the characteristic for assessing the strength of a grease. According to DIN ISO 2137 it is measured through the penetration depth of a standardised cone.

Classification of greases to NLGI

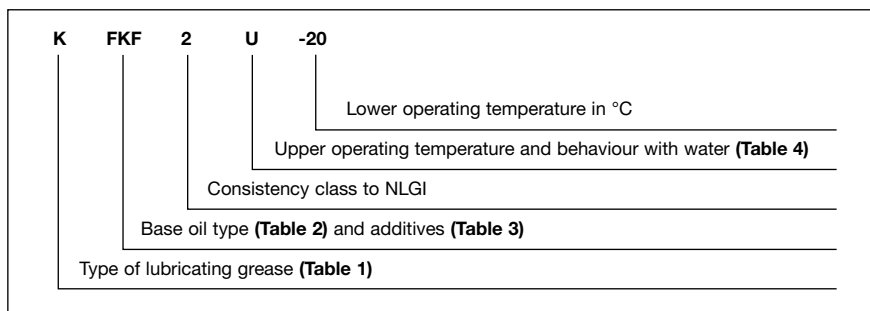

The classification according to NLGI (DIN 51 818) ranges from very soft (Class 000) to very firm (Class 6). Standard lubricating greases usually comply with NLGI Class 2.

NLGI-class	Worked penetration [mm/10]	Gear lubrication	Friction bearings	Roller bearings	Water pumps	Block greases
000	445 – 475	■				
00	400 – 430	■				
0	355 – 385	■				
1	310 – 340	■	■	■		
2	265 – 295		■	■		
3	220 – 250		■	■		
4	175 – 205			■	■	
5	130 – 160				■	
6	85 – 115 Unworked penetration					■

TYPES OF LUBRICANTS

Designation and classification of lubricating greases to DIN 51 502

In view of the multiple possibilities of application and different compositions, lubricating greases are classified and described according to DIN 51 502 by various aspects such as type of lubricating grease, usability, consistency classes (NLGI) and operating temperatures.

Example of a classification to DIN 51 502

Type of lubricating grease	Identifier
Lubricating greases for roller bearings, friction bearings and sliding surfaces (to DIN 51 825)	K
Lubricating greases for closed gears (to DIN 51 826)	G
Lubricating greases for open gears, toothings (adhesive lubricants without bitumen)	OG
Lubricating greases for friction bearings and seals (lower requirements than at lubricating grease K)	M

Table 1

Base oil type	Identifier
ester oils	E
Fluorinated hydrocarbons	FK
Synthetic hydrocarbons	HC
Polyglycols	PG
Phosphoric acid ester	PH
Silicone oils	Si
Other	X

Table 2

Additive	Identifier

Pastes for easy assembly and dismantling

The structure of pastes basically corresponds to that of greases. However, the share of solid lubricants is notably higher. This ensures reliable lubricating, separating and corrosion protection effects also when used under extreme temperature and pressure conditions and aggressive media. Pastes are used at screwed connections as well as when pressing in pins and bolts and furthermore at gearwheels.

Characteristics of pastes

Characteristic	Standard	Description
Press-fit test		Provides information about the lubricating effect of pastes at very high pressure and low sliding speed (relevant for assembly pastes)
Thread friction coefficient	DIN EN ISO 16047	The friction coefficient μ when screws and nuts are tightened is determined on a screw test bench (relevant for screw pastes)
Breakaway torque	DIN 267-27	Ratio of the required breakaway torque when loosening the screwed connection to the tightening torque
Operating temperature		Lubrication: Oil and solid lubricants are effective Separation: After the oil has evaporated, separating effect through solid lubricants

Structure of pastes

Structure of pastes

The structure of high-performance pastes is similar to that of greases. The main difference is the high portion of solid component that is typical of both assembly pastes (lubrication effect only) as well as for screw pastes (lubrication and separation effect).

TYPES OF LUBRICANTS

Fields of applications of pastes

The field of application of pastes is determined to a great extent by the solid lubricant contained.

Solid lubricant	Maximum operating temperature [°C]	Field of application
PTFE	< 300	Mounting, medium influence
MoS ₂	< 450	Mounting, press-on processes
aluminium	< 1100	High-temperature screwed connections
Copper	< 1100	High-temperature screwed connections, "Anti-Seize" paste, el. conductivity
"Oxide" ceramics	< 1400	Extreme-temperature screwed connections, stainless steel screwed connections

Dry lubricants – the alternative for special application cases

Dry lubricants can be classified into powdery solid lubricants, ceraceous sliding films and solid-content bonded coatings.

Structure of bonded coatings

Coating with a bonded coating is carried out after thorough preparation of the surface through immersion, spraying or painting. The dry bonded coating layer is between 10 and 20 µm thick. It withstands high pressure loads and extreme temperatures, does not take up soiling and is characterised by very high chemical stability and an excellent long-lasting lubrication.

Bonded coatings are used in many technical fields, e.g. for nuts, screws, bolts, washers, springs, sealing rings, gearwheels, slideways and threaded spindles.

Structure of bonded coatings

Bonded coatings are solid lubricants (usually MoS₂, graphite or PTFE) that are embedded in a binder. A solvent that evaporates during the curing or drying time is added for the distribution of the bonded coating.

In comparison to classical lubricants bonded coatings are characterised by

- Dry lubrication without oil and grease
- Clean lubrication without dirt adhesion
- Very low friction values can be achieved
- High temperature resistance
- No evaporation losses
- Use in vacuum possible
- Chemical-physical stability
- Effectiveness also at low sliding speeds
- Long-term and lifetime lubrication
- High cost efficiency

TYPES OF LUBRICANTS

Classification of solid lubricants

Solid lubricants are used as fine powder and can be divided by their structure, as well as into chemically and physically active substances. The most common ones are listed here.

	MoS ₂	Graphite	Tri-calcium-phosphate	Zinc-pyro-phosphate	Calcium hydroxide	Aluminium	Zinc sulphide	Zinc oxide	Calcium fluoride	PTFE	PE
Structure-effective with layer lattice structure	■	■									
Chemically effective with layer lattice structure	■										
Chemically effective without layer lattice structure			■	■	■						
Physically effective with layer lattice structure						■	■	■	■		
Physically effective without layer lattice structure										■	■

Lubrication by MoS₂

Molybdenum disulphide MoS₂

The best lubrication properties at metal pairs are achieved with MoS₂ (molybdenum disulphide). The layer lattice structure and the chemically effective properties on the metal surface produce low friction, high pressure absorption capacity and an excellent wear protection. Even thin films produce an extremely stable layer in which the MoS₂ fins slide to each other like a pack of cards.

Share of solid lubricants

Maximum share of solid lubricants in lubricant systems

OKS lubricants – highest performance for maximum process reliability

Numerous test methods are used to examine and evaluate the various influencing variables of a tribological system for the development and quality assurance of lubricants. The collected characteristics describe the chemical/physical properties of a lubricant which allow statements about its possible suitability for a specific application.

Determining the flashing point

Flashing point

The flashing point is a measurand at combustible liquids which allows the danger of fire to be assessed. Depending on the product type and height of the flashing point to be expected the most common measuring methods are closed crucibles (to DIN 51755) or open crucibles (to DIN ISO 2592).

Measuring the thread friction

Thread friction

The thread friction is determined on a screw test bench. According to DIN EN ISO 16047 the coefficient of friction μ of a screwed connection is obtained when screws and nuts are tightened. Thread dimension, materials and type of the surface have to be specified.

Condensed water test

Condensed water test

The condensed water test is one of several examinations carried out to assess a protective layer as corrosive influences (DIN 50017 – KTW condense water temperature alternating climate) and defines the test procedure in a climatic chamber at alternating climate. The result is the number of hours until traces of rust arise.

TESTING PROCEDURES AND STANDARDS

Measuring the consistency

Consistency

The consistency of a lubricating grease is measured with a penetrometer to DIN ISO 2137 whereby the grease is worked before measuring in order to imitate the stress in a bearing. The penetration depth of a cone allows the allocation to a consistency class to NLGI (DIN 51 818).

Determining the breakaway behaviour

Breakaway behaviour

Breakaway behaviour, the ratio of the loosening torque to tightening torque, is determined for high-temperature screw pastes after screws M10 (or M12), material A2-70, have been tightened with 40 Nm (or 70 Nm) and have been subjected to a temperature between +200 °C and +650 °C for 100 hours.

Determining the pour point

Pour point

The pour point of an oil is measured to DIN ISO 3016. It lies some °C under the recommended lowest operating temperature.

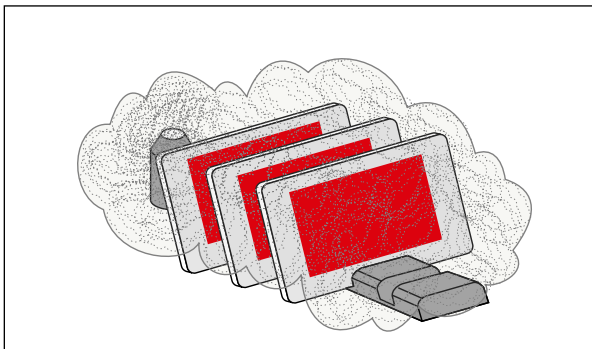

OKS lubricants – highest performance for maximum process reliability

Press-fit-test

Press-fit-test

The Press-fit test provides information on the behaviour and the adhesion of solid lubricants under very high pressure and low sliding speeds. The coefficient of friction μ is measured and noted whether stick-slipping occurs. Both results are important for the applications during mounting work (e.g. press manufacture) or at slideways and guides (e.g. machine tools).

Salt spray test

Salt spray test

The salt spray test simulates a salty climate to DIN EN ISO 9227 NSS (ex DIN 50021 SS), whereby coated plates are subjected to a defined salt spray. A check is carried out after how many hours traces of rust arise.

SKF-EMCOR process

SKF-EMCOR process

This process is used to assess corrosion-preventive properties of roller bearing lubricants. In the process water is added to the grease and examined for corrosion self-aligning ball bearings with defined running duration, speed and specified standstill periods to DIN 51 802. If there is no corrosion at the visible inspection of the test rings, the degree of corrosion is 0. At very strong corrosion the maximum note is 5.

Measuring the drop point

Drop point

The drop point (in °C) is the temperature of a lubricating grease at which liquefaction occurs, measured to DIN ISO 2176. The drop point lies notably over the recommended upper limit of the operating temperature. However, certain grease thickeners do not liquefy, meaning that they are without a drop point.

Four-ball test rig

Four-ball test rig

The four-ball test rig is a testing device for lubricants used at high surface pressures in the mixed friction range. According to DIN 51350, the four-ball test rig consists of a rotating moving ball which slides on three fixed balls. During the test for the maximum load-bearing capacity of the lubricant, a test force acts on the moving ball, which is increased in steps until the four-ball system is welded together as a result of the friction heat produced. In another four-ball test method the wear value of a lubricant is determined under defined test conditions (test force, speed, time).

Measuring the viscosity

Viscosity

The viscosity of an oil is determined with different measuring instruments depending on the type of product. A falling-ball viscometer is used to fulfil the specifications to DIN 51562-1 or similar methods. The specification of the kinematic viscosity V (ny) [mm²/s] is effected at +40°C. The value, for example at +100°C, is often also of interest, so that the drop in the viscosity at higher temperatures can also be assessed.

OKS lubricants – highest performance for maximum process reliability

DN factor

The DN factor or rotating speed factor is a guide value up to which rotating speeds lubricants can be used in roller bearings.

Evaporation loss

The evaporation loss is of interest particularly at high-temperature lubricants. According to DIN 58397 it is examined at high temperatures for a specified period. The loss of evaporated oil as a % by weight should be as low as possible.

FZG torque change test device

With the FZG torque change test device oils and greases are examined in particular with regard to their suitability as lubricants in closed gears. The wear is determined after every load level and the so-called “damage load level” specified as the result. The test method is described in DIN 51354.

Layer thickness (corrosion protection)

The layer thickness has a decisive influence on the duration of the corrosion protection. To this purpose various measuring methods are used which specify the layer thickness in μm , depending on the type of protective layer.

Lubrimeter test

The Lubrimeter test is a test device with which the coefficient of friction, wear and operating temperature of lubricants is measured for a specific period at changing loads and sliding speeds with different materials.

Oil separation

The oil separation is measured to DIN 51817 as a % by weight. In the process pressure and temperature is applied to the lubricating grease to be tested.

Resistance to oxidation

The resistance to oxidation is a measure for the resistance against reactions with pure oxygen. According to DIN 51808 the grease is subjected to increased pressure together with the oxygen for a specific period (e.g. 100 hours) and temperature (e.g. $+99^\circ\text{C}$ or $+160^\circ\text{C}$). The test result is the drop in pressure of the oxygen in Pa (Pascal) as a measure for the degree of oxidation.

Ageing

Chemical changes to material through the influence of heat, light and oxygen across the operating time

Corrosion

Reaction of a metal with its environment which results in a change and impairment of the function of a component

DVGW

Deutscher **V**erein des **G**as- und **W**asserfaches
(German Technical and Scientific Association for Gas and Water)

Emergency lubrication

Is achieved through solid lubricants when insufficient lubrication occurs at grease or oil lubricants

EP additives

Lubricants with **E**xtr**E**m**E** **P**ressure additives in order increase the pressure resistance and the wear protection properties

Frictional corrosion

Corrosion that occurs at fits that are subjected to vibrations with micro frictional movements.
Immediate rust formation at abrasive particles of steel

ISO

International **S**tandardization **O**rganisation

KTW

Approval for plastics in the drinking water sector

LGA

Landesgewerbeanstalt Nürnberg with its institute for food chemistry

Silicone oils

Are produced through synthetic processes. They have particularly good viscosity temperature characteristics, are resistant at low and high temperatures and against ageing. Excellent separating properties. Outstanding lubricant for plastics and elastomers. Designations such as polydimethylsiloxane or polyphenylmethylsiloxane specify the special structure of the molecule groups

Solvent

Liquids that dissolve other materials without chemical changes

Stick-slipping

Occurs at slow movements and insufficient separating effect of the lubricant, since the initial friction is higher than the movement friction

Synthetic oils

Produced through chemical processes in contrast to oils from Nature – mineral oils, vegetable oils and animal oils. Allowing certain advantages to be achieved, such as low tendency to coking, low pour point, good resistance to chemicals and often excellent viscosity temperature characteristics. Synthetic hydrocarbons, ester, polyglycols, fluorinated oils and silicone oils are used e.g. for lubricants

VCI

Volatile **C**orrosion **I**nhibitor is an environmentally friendly corrosion protection additive

Wear

Arises when the lubricating film is breached, so that the sliding partners come into contact and rub against each other

White oil

Paraffinic mineral oil, highly refined, to remove instable components. White oils are used, for example, in lubricants for medical applications

INCREASE IN PERFORMANCE THROUGH ADDITIVES

Intelligent additive technology with Mo_x-Active: Reducing cost and environmental impact

The task of the additives is to optimise lubricants for the respective application with regard to corrosion and wear protection, emergency running properties, oxidation stability, temperature characteristics and wetting behaviour. The careful selection and the intelligent combination of the additives guarantee the high performance of OKS speciality lubricants.

Mo_x-Active additive

OKS speciality lubricants with the Mo_x-Active additive technology developed by OKS contain molybdenum complex compounds for increased performance.

Effect on the surface

Lubricants with Mo_x-Active are responsible for the smoothing of the metal surfaces at the lubricating points. Intelligent additives support and accelerate the flow smoothing process on the otherwise rough surfaces and effect a tribological surface coating. The run-in times can be shortened considerably.

Phase 1

Mo_x-Active is deposited under pressure at the stressed metal surface of the lubricating point.

Phase 2

As the stress increases, a pressure-stable and effective lubricating protective layer is formed and increases the pressure absorption capacity. Friction and wear are reduced considerably.

Phase 3

Mo_x-Active supports and accelerates the flow smoothing process of the metal surface. Best results are achieved here in combination with MoS₂. This structural change produces a tribological surface coating with extremely low coefficient of friction and high wear protection.

Cost reduction and reduction of environmental impact

OKS speciality lubricants with Mo_x-Active reduce the operating costs, increase the quality in production and reduce the environmental impact through lower lubricant consumption and lower energy requirements.

SPECIALITY LUBRICANTS FOR FOOD PROCESSING TECHNOLOGY

NSF certified lubricants for safe food processing and production

OKS speciality lubricants for food processing technology can be used in all areas in which human beings could come into contact with lubricants. Application of these lubricants is not limited to the food processing industry. Typical users are amongst others manufacturers of food packaging, machine and system builders for the food processing industry, producers of domestic appliances as well as the toy and pharmaceutical industries.

With OKS speciality lubricants on the safe side

There is currently no binding European or international legislation for lubricants approved for use in the food processing industry. As a result, in food processing technology and related areas, it is primarily the US regulations, which are the world's strictest, that are utilised.

Positive list of the FDA

This list of the FDA (Food and Drug Administration) that is recognised around the world contains all ingredients permissible in lubricants approved for use in food processing. All lubricants tested by the NSF (National Sanitation Foundation) are published in the white book of the NSF based on this list. You can find the list of these lubricants at www.nsf.org in the chapter entitled "Nonfood Compounds Listings Directory", arranged by company name.

NSF classification

The classification NSF H1 stands for lubricants which may be used when contact with food cannot be excluded in the event of failure.

The lubricants that may be used when contact with food is technically excluded are summarised under NSF H2.

EC Directive 93/43/EEC (issued 14/6/93)

This directive requires food processing plants to use the HACCP (Hazard Analysis Critical Control Point) method. This preventative system ensures that every contamination-relevant step in the manufacturing process of a food processing and production can be identified and monitored. Even if this directive contains no regulations with regard to the ingredients of lubricants approved for use in food processing, the HACCP method describes the use of lubricants in food processing technology.

By using OKS speciality lubricants for food processing technology, you ensure compliance with national and international regulations – because of your responsibility to people.

LUBRICANT SOLUTIONS FOR CRITICAL APPLICATION CONDITIONS

OKS experts stand for innovative ideas and product concepts

Movement without friction is a dream of mankind. But friction still remains a fact of life. To ensure “frictionless” running of your machines, OKS can provide a lubricant solution for almost any application. Whether the lubrication of roller bearings, chains or slideways, under extreme conditions of use or under the influence of aggressive media – with lubricants from OKS you solve your tribological problems safely and reliably.

Extreme conditions of use

Ever more productive machines, combined with extended operating lives push materials and machine elements to their stress limits. OKS offers lubricants that unfold their full performance even under these conditions. Various OKS speciality lubricants resist extreme temperatures, high temperature fluctuations or high pressures.

Plastic lubrication

New design developments mean that friction pairs are increasingly being used that place particular requirements of the compatibility of the lubricants. Special alloys or ceramic elements are used. Material combinations of plastic/metal and plastic/plastic are increasingly also being used. OKS provides lubricants that are compatible with many materials.

Lubrication under the influence of aggressive media

Whether in permanent use with contact to acids or lyes at columns, boilers or pipings in process engineering industries, at corrosive influences, at outdoor weathering or under the influence of salt water, your plants remain completely operational also under these conditions thanks to OKS speciality lubricants.

Fields of Application

	Roller bearings		Valves		Measuring devices		Dust removal
	Friction bearings		Press fittings		Precision mechanics		Leak detection
	Chains		Moulding		Hinges		Belt drives
	Pivoting bearings		Splined shafts		Wire cables		Offshore
	Levers		Camshafts		Hydraulics		Storage/Shipping
	Slideways		Springs		Compressors		Steel construction
	Linear guide systems		Brakes		Separating - mould release		Sheet-metal processing
	Spindles		Open gears		Separating - weld release		Rust remover
	Threaded connections		Closed gears		Cleaning		Foam cleaning
	Chucks		Worm gears		Electrical contacts		
	Seals		Cutting tools		Cooling		

Properties

	High temperatures		Effects of water		Environmentally friendly		Foam forming
	Low temperatures		Effect of chemicals		Workplace-friendly		
	High speeds		Corrosion protection		NSF certified		
	Heavy loading		Compatible with plastics		Sprayable with Airspray-System		
	Effects of weathering		Long-acting		Electrical engineering/ Electronics

PASTES FOR EASY ASSEMBLY AND DISMANTLING

Pastes

Product	Designation	Fields of Application	Purpose
OKS 200 Mo_x-Active	MoS ₂ Assembly Paste		<ul style="list-style-type: none"> • Assembly lubrication for press-on processes • Run-in lubrication of highly loaded sliding surfaces • Lubricant for difficult moulding processes • Prevents wearing, stick-slip, seizing, run-in damage or pitting • For universal use
OKS 217	High-Temperature Paste, high purity		<ul style="list-style-type: none"> • Assembly lubrication of screw threaded connection made of high-strength steel, at high temperatures in aggressive environment • Optimum ratio of screw tightening torque to achievable pre-tension • No burning together and rusting on • No reaction with metals • For use in the chemical industry
OKS 220 OKS 221* Mo_x-Active	MoS ₂ Rapid Paste		<ul style="list-style-type: none"> • Assembly lubrication for press-on processes • Run-in lubrication of highly loaded sliding surfaces • Lubricant for difficult moulding processes • Effective immediately through high MoS₂ share • Rubbing in the paste not required • High-quality assembly paste
OKS 230	MoS ₂ High-Temperature Paste		<ul style="list-style-type: none"> • For high-temperature applications up to 450°C (dry lubrication from approx. 200°C) • Prevents wearing, stick-slip, seizing, run-in damage, pitting • Carrier oil evaporates residue-free from 200°C upwards • Bearings of pouring ladles, converters, kiln cars, or similar • Relubrication in operation with OKS 310
OKS 235 OKS 2351*	Aluminium Paste, Anti-Seize Paste		<ul style="list-style-type: none"> • For assembling screw and bolt threaded connections that are subjected to high temperatures and corrosive influences • Optimum ratio of screw tightening torque to achievable pre-tension • Prevents burning together or rusting on • Prevents seizing • Use as lubricating and separating paste
OKS 240 OKS 241*	Antiseize Paste (Copper Paste)		<ul style="list-style-type: none"> • For assembling screw threaded connections subjected to high temperatures and corrosive influences • Prevents burning together or rusting on • Optimum ratio of screw tightening torque to achievable pre-tension • Classic anti-seize paste
OKS 245	Copper Paste with High Corrosion Protection		<ul style="list-style-type: none"> • For screws, bolts and sliding surfaces subjected to high temperatures, water or sea water • Prevents burning together and rusting on • Prevents seizing during assembly • Highly adhesive • Excellent corrosion protection • Suitable for brake systems

OILS WITH HIGH-PERFORMANCE ADDITIVES FOR RELIABLE LUBRICATION

Oils

Product	Designation	Fields of Application	Purpose
OKS 30	Mo_x-Active Additive		<ul style="list-style-type: none"> • EP additive for universal use as additive to industrial oils • Improves the run-in lubrication of new and overhauled machines • Smoothing of the surfaces results in lower wear and thermal loading of the lubricant • Makes longer lubricating intervals possible
Mo_x-Active			
OKS 300	MoS₂ Mineral Oil-Concentrate		<ul style="list-style-type: none"> • Additive on MoS₂ and Mo_x basis • Reduces friction, temperature and wear • Smoothens the surfaces • Creates emergency-running properties • Passes common filters, does not react to magnetic filters • Additive to gear, engine and machine oils
Mo_x-Active	ISO VG 100		
OKS 310	MoS₂-High-Temperature Lubricating Oil		<ul style="list-style-type: none"> • Lubrication of machine elements up to +450 °C • Residue-free evaporation of the base oil above +200 °C • Dry lubrication from +200 °C to +450 °C • Lubrication in steelworks, foundries, rolling mills, ceramics industry
	ISO VG 100		
OKS 335	Metal-Fluid		<ul style="list-style-type: none"> • Lubrication of heavily loaded sliding surfaces at high temperatures • Highly effective due to formation of press-resistant separating sliding layers • Can be sprayed and brushed • For rotary-oven bearings, at stop faces of axial guides, as well as as screw compound for hot screwed connections
OKS 340 OKS 341*	Chain Protector, strongly adhesive		<ul style="list-style-type: none"> • Synthetic lubricant for machine elements subjected to high pressure or corrosive influences • Extremely high creep capacity • Highly adhesive and resistant to throwing off • Excellent wear protection • O-ring neutral • For fast-running chains
Mo_x-Active	ISO VG 460 DIN 51 502: CLP X 460		
OKS 350	High-Temperature Chain Oil with MoS₂, synthetic		<ul style="list-style-type: none"> • Synthetic oil for machine elements at high temperatures • Highly load-bearing capacity due to finest, homogeneous MoS₂ distribution in oil • Emergency running properties through MoS₂ at dry running • Outstanding adhesion and lubrication effect with no tendency to drip or dry out • Silicone-free
Mo_x-Active	ISO VG 220		
OKS 352 OKS 3521*	High-Temperature Oil, light-coloured, synthetic		<ul style="list-style-type: none"> • Synthetic high-temperature oil • Good wear protective through EP additives • Excellent oxidation protection, therefore resistant to ageing • Low tendency to drip at high temperatures • Minimal evaporation losses • Residue-free evaporation • Good water and steam resistance
ChronoLube System	DIN 51 502: CLP E 320

DRY LUBRICANTS – THE ALTERNATIVE FOR SPECIAL APPLICATION CASES

Dry Lubricants

Product	Designation	Fields of Application	Purpose
OKS 570 OKS 571*	PTFE Bonded Coating		<ul style="list-style-type: none"> • Dry lubrication of sliding surfaces of different materials at low pressures, low speeds and in dusty environments • Prevents tribocorrosion • Dries at room temperature • No-soiling sliding and parting film
OKS 575	PTFE Water Bonded Coating		<ul style="list-style-type: none"> • For sliding surfaces made of different materials at low pressures, low speeds and in dusty environments • Avoids squeaking at differently hard materials • Dries at room temperature • Verifiable with UV indicator • Can be diluted with water
OKS 589	MoS ₂ PTFE Bonded Coating, thermosetting		<ul style="list-style-type: none"> • Dry lubrication of sliding surfaces under heavy loads and low speeds • Prevents friction and wear • No adhesion of dust and dirt • Use in a broad temperature range
OKS 1300 OKS 1301*	Sliding Film, colourless		<ul style="list-style-type: none"> • Thread coating • Sliding film for plastic, wood and metal • Dry sliding film fast to handling • Verifiable with UV indicator • Prevents seizing • For all screw materials • Broad range of uses, in particular for precoating small and mass-produced parts
OKS 1710	Sliding Film for Screws, water-based concentrate		<ul style="list-style-type: none"> • Thread coating, also for galvanic surfaces and VA screws, for controlled assembly • Dry sliding film fast to handling • Verifiable with UV indicator • Can be diluted with water in a ratio of up to 1:5 • Economic precoating
OKS 1750	Sliding Film for Wood Screws, water-based concentrate		<ul style="list-style-type: none"> • Coating of threads with galvanised surfaces • Dry sliding film fast to handling • Verifiable with UV indicator • Can be diluted with water in a ratio of up to 1:5 • In particular for chipboard screws
OKS 1765	Sliding Film for Thread-Cutting Screws, water-based concentrate		<ul style="list-style-type: none"> • Coating of thread-cutting screws made of high-alloy steels, galvanised and austenitic steels • Dry sliding film fast to handling • Prevents cold welding • Can be diluted with water in a ratio of up to 1:5

CLEANERS FOR THOROUGH REMOVAL OF SOILING AND LUBRICANT RESIDUES

Cleaners

Product	Designation	Fields of Application	Purpose
OKS 2610 OKS 2611*	Universal Cleaner		<ul style="list-style-type: none"> • For machine parts and surfaces with oily or greasy soiling • Evaporates quickly and residue-free • High cleaning power • Cleaner for lubrication and glueing points
OKS 2621	Contact Cleaner		<ul style="list-style-type: none"> • To remove soiling that can cause creepage currents • No running thanks to fast evaporation • For example, for cleaning distribution boards, switches, relays, potentiometers, plug-in connections, sliding and screw contacts
OKS 2631	Multi-Foam Cleaner, Spray		<ul style="list-style-type: none"> • Removes firmly adhering organic soiling such as nicotine, fat and silicone films • Cleans metals, plastics, glass and rubber in the gastronomy, office and vehicle fields gently and without leaving stripes • Ideally suitable for vertical surfaces
OKS 2650	BIologic Industrial Cleaner, water-based concentrate		<ul style="list-style-type: none"> • Aqueous cleaner for removing heavy oily, greasy and sooty soiling • Biodegradable • Good separation behaviour • Gentle to delicate surfaces • For universal use in industry, workshop and food processing technology
OKS 2660 OKS 2661*	Fast Cleaner		<ul style="list-style-type: none"> • For machine parts and surfaces with oily or greasy soiling • Evaporates quickly and residue-free • High cleaning power • Ideal for preparation of bonded connections and cleaning of lubricating points • Brake cleaner
OKS 2670 OKS 2671*	Intensive Cleaner for the Food Processing Industry		<ul style="list-style-type: none"> • For removing aged and gummy oil and grease residues • For dissolving silicone and adhesive residues • Evaporates quickly and residue-free • High cleaning action • Good compatibility to common plastics • For use in the food processing, livestock feed and pharmaceutical industries
OKS 2681	Adhesive and Paint Remover		<ul style="list-style-type: none"> • For the removal of stubborn impurities, such as residues of sealants, paints and adhesives, bitumen and tar splashes • Can be used on metal, stainless steel, glass, wood and ceramics • Can be washed off well with water after use • Low effect on climate • For use in industry, workshops and trade

BIologic

Cleaners

Properties / Approvals	Main Components	Application tips	Packaging
	colourless solvent mixture	Generously wet or spray the surfaces to be cleaned from a short distance and rub down with cloths if necessary. Then allow to dry at room temperature. Check resistance of plastics and paintwork before using.	5 l canister 25 l canister 25 l drum 200 l drum 500 ml aerosol*
	colourless solvent mixture	Switch off voltage and discharge electrostatic charging before use. Spray until desired cleanliness is achieved. Due to the wide variety of plastics used in electrical engineering, check plastics for corresponding resistance before use.	400 ml aerosol
 Stress crack test to DIN EN ISO 22088-3 passed	bluish anionic surfactants additives water	Shake can well before use. Spray on evenly from a distance of about 20 – 30 cm. Wipe off with a clean cloth. In the case of special coating check for compatibility.	400 ml aerosol
 NSF A1 Reg. No. 129003	red non-ionic surfactants silicates	Depending on the degree of soiling, can be diluted with water to a maximum of 1:10. pH value: 11.0 (concentrate)	500 ml pump sprayer 5 l canister 25 l canister 200 l drum
	colourless solvent mixture	Generously spray the surfaces to be cleaned from a short distance and rub down with cloths if necessary. Then allow to dry at room temperature. Check resistance of plastics and paintwork before using.	25 l canister 56 l drum 600 ml aerosol*
 OKS 2670: NSF K1 / K3 Reg. No. 149997 OKS 2671: NSF K1 / K3 Reg. No. 149998	colourless solvent mixture	Generously wet the surfaces to be cleaned and, if necessary, support the cleaning process through rubbing down. Subsequently allow to dry completely at room temperature. Do not use at surfaces made of EPDM elastomers and silicones. In case of sensitive materials check the suitability before use. Caution: Observe the specifications of the NSF when used in the food processing industry.	5 l canister 25 l canister 200 l drum 400 ml aerosol*
	colourless solvent mixture	Shake can well before use. Spray onto the surfaces to be cleaned and, depending on the degree of soiling, allow it to react for a longer period. Subsequently wipe off with a moist cloth. Check resistance of plastics and painted surfaces before using.	400 ml aerosol

The economic and ecological alternative to the spray can

The pressure spray system consists of the Airspray can and a unit for filling the can with product and compressed air. The air serves as a harmless propellant gas. OKS products such as oils and cleaning agents can be processed by means of corresponding valves and spray heads.

Avoiding waste – reducing costs

The OKS Airspray-System prevents waste and reduces costs. Disposal cost that would arise if spray cans were used, are reduced. A small investment in environmental protection that pays off rapidly.

Robust and safe

The indestructible Airspray can was developed specially for rough usage in industrial operation and in workshops. In order to ensure that the specified hazardous substances marking and a clear assignment of the filled can to the product are fulfilled, corresponding product labels are provided for download at www.oks-germany.com.

Proven and favourable

Whether in the workshop or in industrial maintenance. For more than 15 years the Airspray-System has proven itself as the trouble-free and inexpensive alternative to the spray can.

Cost efficiency calculation for OKS 2610 Universal Cleaner

OKS Airspray filling station in comparison to conventional spray can

A comparison of the cost effectiveness of the OKS Airspray-System with the use of conventional OKS 2611 spray cans shows that a cost reduction through the use of the OKS Airspray-System already results after the use of 25 spray cans.

System components and products

Filling station for use in workshops

The filling station allows simple filling of the Airspray can with compressed air. It is suitable for fixed mounting for example near the product location or at the workplace.

How to do it: Fill the product into the Airspray can, insert the rising tube with adapter, place the valve with spray head onto the adapter and screw handtight with the union nut. Place the can with the valve on the filling station, press down for approx. 2 s. Ready to spray.

Automatic filling unit for industrial users

The automatic filling unit allows filling of the Airspray can with product and compressed air in one pass.

How to do it: The automatic filling unit is connected to the product container through the suction line. The Airspray can is pressed into the "Active substance-air tapping point" (red) for filling. The can can be filled or refilled with compressed air through the additional "Air tapping point" (black).

Airspray spray sets

A Universal spray set which is not product-specific allows the perfect usage of the Airspray can with the applicable OKS products. This spray set encompasses three different spray heads which differ in their spray pattern and spray rate and can thus be selected flexibly to ideally suit the respective application conditions. The spray heads are fitted with Viton seals to achieve high application stability. To allow clear allocation of the filled can to the OKS product used the corresponding labels can be downloaded under www.oks-germany.com. The blank label templates for printing are enclosed with the spray set.

Drain cocks

Reusable drain cocks for filling into the Airspray can without dripping or leaking, suitable for all 5 l and 25 l OKS plastic canisters.

The following OKS products are suitable for use with the Airspray-System

- OKS 370
- OKS 390
- OKS 600
- OKS 640
- OKS 700
- OKS 1510
- OKS 1600
- OKS 2610
- OKS 2650
- OKS 2660
- OKS 2670
- OKS 2800
- OKS 8600

The OKS Airspray-System on Youtube.

Further details on the application and the usage of the OKS Airspray system are provided in the **operation manual** that can be obtained in the download section of www.oks-germany.com.

Electromechanical lubricating systems – automatic and independent of temperature

ChronoLube is the ideal combination of OKS speciality lubricants with an electromechanical lubricator. This enables the automatic supply of lubricating points with oil and grease. In the dosage you require and at the right time – without under- or over-lubrication.

Simply install the ChronoLube Drive together with the suitable ChronoLube Cartridge at the lubricating point and set the dispensing time (in monthly steps) in accordance with your requirements.

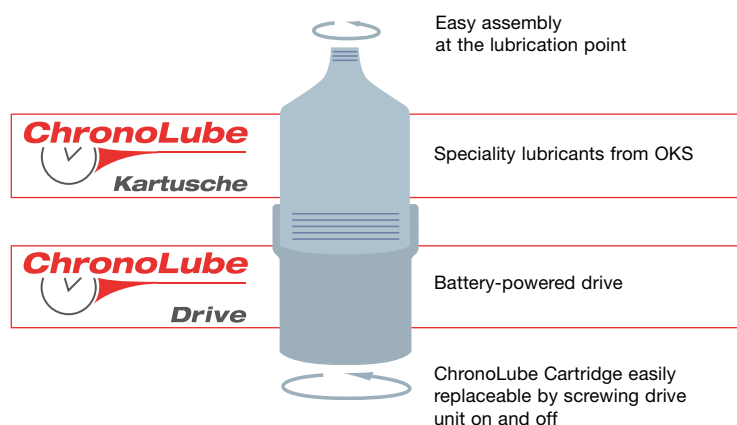

Whether lubricating point that is difficult to reach, strong vibrations or extremely high ambient temperatures, OKS can provide you with the right accessories for trouble-free use of the ChronoLube-System. We will be pleased to advise in detail.

ChronoLube, the ideal lubrication system for:

- Roller bearings
- Friction bearings
- Chains
- Open gears
- etc.

Highlights

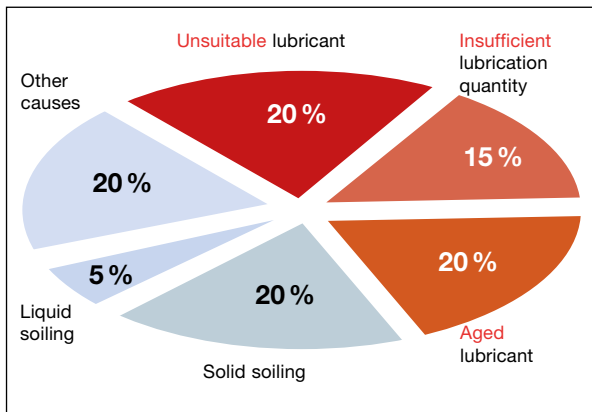

- Operating temperature -10 °C to +60 °C
- Continuous fill level monitoring with transparent housing
- Dispensing time can be set in monthly steps
- Dispensing duration individually adjustable when changing cartridge
- Display of operating state with LCD display (e.g. operation, empty, fault)
- Reusable drive
- Replaceable battery set

After setting the dispensing time, an additional check of the operating state takes place with the integrated LCD display.

OKS CHRONOLUBE-SYSTEM

Causes of failure of roller bearings

Avoid damage and save cost

Continuous, automatically controlled lubrication by ChronoLube mainly prevents: annoying, expensive production downtimes. Thanks to precise, individually adjusted lubricant dosage, a sudden standstill or frequent maintenance intervals due to poor lubrication are now a thing of the past.

Comparison: Automatic vs. manual relubrication

Comparison of lubrication systems

ChronoLube is highly superior to manual relubrication and lifetime lubrication with regard to precision and reliability.

ChronoLube
System

The ChronoLube-System is identified by this sign.

LUBRICATING DEVICES FOR PRACTICAL USE

Solutions for continuous use in industry

Lever grease gun

The practical grease gun for reliable, economical application of greases. Thanks to its well thought-out design and rugged construction, it stands up under even the toughest conditions. Available separately or in the Lubricating Set (20 cartridges of OKS 400 including a lever grease gun).

Sprayboy

Together with the spray can, the sprayboy becomes the perfect spraying device. It enables simple, fatigue-free handling and exact, controlled dosing of the spray mist. (Suitable for all OKS standard spray cans with a size of 400 ml or bigger. Do not use together with Airspray can).

Adapter set for Reiner lever grease gun

The adapter set for the Reiner lever grease gun system for rapid and simple conversion to 400 ml DIN cartridges. Thanks to its simple mounting, all OKS product cartridges can be used with the Reiner lever grease gun without much additional effort or high additional costs.

Available as a set with 10 adapters each with threads and cartridge covers, a reducing ring and mounting instructions.

WHAT YOU CAN EXPECT FROM OKS – PERFORMANCE THAT MOVES

Maximum product quality, active occupational health and safety and consistent environmental protection

These three factors form the major factors for the sustainable success of our company and our industrial and commercial customers worldwide.

OKS is oriented towards the development, production and sales of lubricants, maintenance and corrosion protection products of the highest possible quality. Our focus lies on customers who are satisfied with our products and our performance.

All employees are committed to the high quality, environmental protection and work protection demands. Continuous personnel development results in active participation in implementing the corresponding targets.

Our high quality and environmental standards are already ingrained in our product development. Environmental protection and the user's safety have the greatest priority for us. Not only through our environmentally conscious company management, but in particular through the development of state-of-the-art lubricants do we contribute to a marked reduction of the negative environmental impact caused by technical factors.

We utilise modern production processes in manufacturing our products. In safe and environmentally friendly production processes we keep the effect on man and environment as small as possible.

In cooperation with our local sales partners we place great emphasis on qualification and thus ensure excellent consulting services and competence in solving problems locally.

Our participation in the initiative "We all take care", an initiative of the Freudenberg Group for environmental and work protection and for the reduction of occupational accidents, is further proof that our goals are corporate practice.

The high OKS quality standard is proven by our certification by the TÜV SÜD Management Service GmbH in the fields of quality (ISO 9001:2008), environment (ISO 14001:2004) and work protection (OHSAS 18001:2007).

Over 150 high-performance products from one supplier

www.oks-germany.com

- **Pastes** for easy assembly and dismantling
- **Oils** with high-performance additives for reliable lubrication
- **Greases** for long-term lubrication under critical operation conditions
- **Dry lubricants** – the alternative for special application cases
- **Corrosion protection** for reliable preservation during storage and shipping
- **Maintenance products** for ongoing service
- **Cleaners** for thorough removal of soiling and lubricant residues

For your company's individual lubrication requirements please contact OKS.

CONSULTING AND SALES

The information in this publication reflect state-of-the-art technology, as well as extensive testing and experience. Due to the diversity of possible applications and technical realities, they can only serve as recommendations and are not arbitrarily transferable. Therefore, no obligations, liability or warranty claims can be derived from them. We only accept liability for the suitability of our products for particular purposes, and for certain properties of our products, in the event that we have accepted such liability in writing in the individual case. Any case of justified warranty claims shall be limited to the delivery of replacement goods free of defects or, in the event that this subsequent improvement fails, to reimbursement of the purchase price. Any and all further claims, in particular the liability for consequential injuries or damage, shall always be excluded. Prior to use, the customer must conduct its own testing to prove suitability. No liability accepted for spelling mistakes, typing errors, miscalculations and translation errors. The data are subject to change for the sake of progress. © = registered trademark
